	A	B	C	D	E	F
1	ITCS-6112 Group 5 - Help Desk System with AI Enhancements					
2	Story ID	Epic	User Story	Points	Priority	Sprint
3	US-01	Authentication	As a user, I want to log in securely so that I can access the help desk.	5	High	1
4	US-02	Authentication	As an administrator, I want role-based access so that users ONLY access authorized features.	3	High	1
5	US-03	Ticket Management	As an end-user, I want a submit a support ticket so that I can request assistance.	3	High	1
6	US-04	Ticket Management	As an end-user, I want to view my submitted ticket so that I can monitor their progress.	5	High	1
7	US-05	Ticket Management	As a user, I want to tickets to have categories, priorities, and statuses so that requests are organized consistently.	3	High	1
8	US-06	Agent Workflow	As a support agent, I want to view tickets assigned to me so that I can manage my workload.	5	High	1
9	US-07	Agent Workflow	As a support agent, I want to update ticket statuses so that users can track progress.	5	High	1
10	US-08	Agent Workflow	As a manager, I want to assign tickets to support agents so that requests reach the appropriate staff.	5	High	2
11	US-09	Communication	As a user or an agent, I want to exchange messages on a ticket so that I can clarify and resolve an issue.	5	High	2
12	US-10	Ticket Management	As an end user, I want to edit eligible ticket details so that I can correct information I submitted.	3	Medium	2
13	US-11	Ticket Management	As a support agent, I want to close or reopen tickets so that resolution status is accurately maintained.	3	High	2
14	US-12	Audit and History	As a support agent, I want to view ticket activity history so that I can understand previous actions.	3	Medium	2
15	US-13	Attachments	As an end-user, I want to attach files to a ticket so that I can provide screenshots or supporting evidence.	5	Medium	2
16	US-14	Notifications	As a user, I want notifications about ticket updates so that I know when action is required.	3	Medium	2
17	US-15	AI Triage	As a support agent, I want AI to suggest ticket categories so that requests can be classified faster.	5	High	2
18	US-16	AI Triage	As a support agent, I want AI to identify possible urgency and priority so that critical requests receive attention.	5	High	2
19	US-17	AI Assistance	As a support agent, I want an AI-generated ticket summary so that I can understand lengthy conversations quickly.	3	Medium	2
20	US-18	AI Assistance	As a support agent, I want AI-generated reponse suggestions so that I can draft more replies more efficiently.	5	High	3
21	US-19	AI Chatbot	As an end-user, I want an AI chatbot to answer common questions so that I can find more help quickly.	5	Medium	3
22	US-20	Analytics	As an administrator, I want a dashboard of ticket volumes, statuses, and resolution trends so that I can monitor support performance.	3	Medium	3
23	US-21	Administration	As an administrator, I want to configure AI assistance options so that AI features can be managed responsibly.	3	Low	3
24				Total: 85		

Sprint Allocation

Sprint	Stories	Points	Backlog Share
Sprint 1	US-01, US-02-US-03, US-04, US-05, US-06, US-07	29	34.1%
Sprint 2	US-08, US-09, US-10, US-11, US-12, US-13, US-14	27	31.8%
Sprint 3	US-15, US-16, US-17, US-18, US-19, US-20, US-21	29	34.1%

Sprint 1 Report

Planned stories: US-01, US-02, US-03, US-04, US-05, US-06, US-07 · 29 points · Objective: Establish the secure foundation and core ticket lifecycle for end users and support agents.

1. Functionality at the end of this sprint (2 pts)

At the end of Sprint 1, the Help Desk System provides its core authentication, authorization, and ticket-management capabilities. Users can securely log in, while administrators use role-based access to ensure that users only access authorized features. End users can submit support tickets and view their own submitted tickets to monitor progress. Tickets are organized using categories, priorities, and statuses. Support agents can view their assigned tickets and update ticket statuses as requests move through the support process. This sprint establishes the foundation for the communication and AI features planned for later sprints.

Expected project contribution: The sprint builds on the previous increment and creates a usable progression toward the full help desk workflow. The functionality described here should be treated as the sprint outcome only if it was implemented; integrated, and demonstrated by the team.

2. User stories successfully implemented (1 pt)

The following table lists the stories assumed to have been successfully implemented in this sample report. This assumption must be checked against the team's actual sprint review and definition of done before submitting.

Story ID	Epic	User Story	Points	Priority	Sprint
US-01	Authentication	As a user, I want to log in securely so that I can access the help desk.	5	High	1
US-02	Authentication	As an administrator, I want role-based access so that users ONLY access authorized features.	3	High	1
US-03	Ticket Management	As an end-user, I want a submit a support ticket so that I can request assistance.	3	High	1
US-04	Ticket Management	As an end-user, I want to view my submitted ticket so that I can monitor their progress.	5	High	1
US-05	Ticket Management	As a user, I want to tickets to have categories, priorities, and statuses so that requests are organized consistently.	3	High	1
US-06	Agent Workflow	As a support agent, I want to view tickets assigned to me so that I can manage my workload.	5	High	1
US-07	Agent Workflow	As a support agent, I want to update ticket statuses so that users can track progress.	5	High	1

3. Changes, breakdowns, and newly identified stories

For this sample report, the team retained the original Sprint 1 user stories and their planned objectives. No additional breakdowns or changes to acceptance criteria were required, and no new stories were identified for immediate implementation. The team kept the original product backlog as the source of requirements.

4. Lessons learned and what to do differently next time

The team learned that authentication, role-based permissions, and ticket ownership must be established before adding more advanced functionality. Ticket submission, ticket viewing, and status management also need to work together consistently. For the next sprint, the team would begin integration testing earlier, assign development responsibilities clearly, and verify database relationships and authorization rules before adding more features.

5. Updated numbered lists of stories yet to be implemented, with preconditions and postconditions

Assuming all planned stories in Sprints 2 through 3 were completed. The following 14 stories remain in the product backlog. This list is numbered and includes the proposed preconditions and postconditions for each story.

#	ID / points	User Story	Preconditions	Postconditions
1	US-08 5 pts	As a manager, I want to assign tickets to support agents so that requests reach the appropriate	The manager is authenticated; the ticket and eligible support agent exists.	The assignment is saved and the ticket appears in the selected agent's queue.
2	US-09 5 pts	As a user or an agent, I want to exchange messages on a ticket so that I can clarify and resolve an issue.	The user or agent is authenticated and authorized to access the ticket.	A message is saved with its author and timestamp and is visible to authorized participants.
3	US-10 3 pts	As an end user, I want to edit eligible ticket details so that I can correct the information I submitted.	The end-user is authenticated, owns the ticket, and the ticket is in an editable state.	Permitted ticket details are updated; restricted fields and ineligible tickets remain unchanged.
4	US-11 3 pts	As a support agent, I want to close or reopen tickets so that resolution status is accurately maintained.	The support agent is authenticated and authorized; the ticket exists.	The ticket moves to the selected valid state and the change is saved.
5	US-12 3 pts	As a user, I want to view ticket history so that I can understand previous actions.	The user is authenticated and authorized to view the ticket.	A chronological record of relevant ticket events is displayed.
6	US-13 5 pts	As an end user, I want to attach files to a ticket so that I can provide screenshots or supporting evidence.	The end-user is authenticated; upload rules, allowed file types, and file limits are defined.	Allowed files are stored or linked to the ticket and are accessible to authorized users.
7	US-14 3 pts	As a user, I want notifications about ticket updates so that I know when action is required.	The user is associated with a ticket and a notification-triggered event occurs.	A notification is generated or delivered through the configured notification channel.

8	US-15 5 pts	As a support agent, I want AI to suggest ticket categories so that requests can be classified faster.	Ticket text is available and the AI categorization service is configured.	A suggested category is presented to the agent for review.
9	US-16 5 pts	As a support agent, I want AI to identify possible urgency and priority so that critical requests receive attention.	Ticket content is available and the AI recommendation service is configured.	An urgency and priority recommendation is presented to the agent for review.
10	US-17 3 pts	As a support agent, I want an AI-generated ticket summary so that I can understand lengthy conversations quickly.	The ticket contains conversation content and the AI summarization is available.	A concise summary is generated and shown to an authorized agent.
11	US-18 5 pts	As a support agent, I want AI-generated response suggestions so that I can draft more replies more efficiently.	The agent is viewing a ticket with sufficient context and the AI response-generation service is available.	A draft response suggestion is presented for agent review and editing; the agent retains control over sending it.
12	US-19 5 pts	As an end-user, I want an AI chatbot to answer common questions so that I can find more help quickly.	The chatbot interface and approved help information are available.	The chatbot provides a relevant answer or directs the user to support when it cannot answer reliably.
13	US-20 3 pts	As an administrator, I want a dashboard of ticket volumes, statuses, and resolution trends so that I can monitor support performance.	The administrator is authenticated and ticket records contain reportable status and timing information.	The dashboard displays ticket volume, status, and resolution when it cannot answer reliably.
14	US-21 3 pts	As an administrator, I want to configure AI assistance options so that AI features can be managed responsibly.	The administrator is authenticated and has permission to manage AI configuration.	AI assistance settings are saved and applied to the relevant AI features.

6. Next-spring selection or final sprint disposition

Sprint 2 selects US-08 through US-14, totaling 27 points (31.8% of the 85-point backlog). These stories depend on the secure roles and core ticket records established in Sprint 1. The expected next increment adds manager assignment, ticket messaging, eligible ticket editing, close/reopen actions, ticket history, attachments, and notifications.

Selected next-sprint stories and points: US-08, US-09, US-10, US-11, US-12, US-13, US-14 — 27 points (31.8% of the full backlog). The selected scope is approximately one-third of the total backlog and follows the dependencies established by the preceding speed.

Expected functionality after the next sprint: At the end of Sprint 2, the system supports more complete ticket operations. Managers can assign tickets to appropriate support agents. Users and agents can exchange messages through individual tickets to clarify issues and provide updates. End users can edit eligible ticket details, while agents can close or reopen tickets to maintain accurate resolution statuses. Authorized users can review ticket history, end users can attach screenshots and supporting files, and notifications inform users about important ticket updates. These additions make the system more useful for day-to-day support collaboration.

Sprint 2 Report - Ticket Operations and Communications

Planned stories: US-08, US-09, US-10, US-11, US-12, US-13, US-14 · 27 points · Objective: Complete ticket collaboration and support operations before the AI-focused work.

1. Functionality at the end of this sprint

At the end of Sprint #2, the system supports more complete ticket operations. Managers can assign tickets to appropriate support agents. Users and agents can exchange messages through individual tickets to clarify issues and provide updates. End users can edit eligible ticket details, while agents can close or reopen tickets to maintain accurate resolution statuses. Authorized users can review ticket history, end users can attach screenshots and supporting files, and notifications inform users about important ticket updates. These additions make the system more useful for day-to-day support collaboration.

Expected project contribution: This sprint builds on the previous increment and creates a usable progression toward the full help desk workflow. The functionality described here should be treated as the sprint outcome only if it was implemented, integrated, and demonstrated by the team.

2. User Stories Successfully Implemented

The following table lists the stories assumed to have been successfully implemented in this report. This assumption must be checked against the team's actual sprint review and definition of done before submitting.

US-08	Agent Workflow	As a manager, I want to assign tickets to support agents so that requests reach the appropriate staff.	5	High	2
US-09	Communication	As a user or an agent, I want to exchange messages on a ticket so that I can clarify and resolve an issue.	5	High	2
US-10	Ticket Management	As an end user, I want to edit eligible ticket details so that I can correct information I submitted.	3	Medium	2
US-11	Ticket Management	As a support agent, I want to close or reopen tickets so that resolution status is accurately maintained.	3	High	2
US-12	Audit and History	As a support agent, I want to view ticket activity history so that I can understand previous actions.	3	Medium	2
US-13	Attachments	As an end-user, I want to attach files to a ticket so that I can provide screenshots or supporting evidence.	5	Medium	2
US-14	Notifications	As a user, I want notifications about ticket updates so that I know when action is required.	3	Medium	2

3. Changes, Breakdowns, and Newly Identified Stories

For this report, the team retained the original Sprint 2 user stories and their planned objectives. No further story breakdowns or acceptance-criteria changes were required, and no new stories were identified for immediate implementation. The team focused on integrating assignments, messaging, attachments, history, and notifications with the core ticket workflow.

4. Lessons learned and what to do differently next time

The team learned that the ticket-management features must operate as one consistent workflow. An assigned ticket should appear in the selected agent's queue; messages must remain associated with the correct ticket; and ticket history should reflect relevant actions. File attachments and notifications also require validation and access control. For Sprint #3, the team would prioritize integration testing between the ticket modules and AI-services and ensure agents review AI-generated content before using it.

5. **Updated numbered list of stories yet to be implemented, with preconditions and post conditions**

Assuming all stories in Sprint 3 were completed, the following 7 stories remain in the backlog:

#	ID / points	User Story	Preconditions	Postconditions
1	US-15 5 pts	As a support agent, I want AI to suggest ticket categories so that requests can be classified faster.	Ticket text is available and the AI categorization services are configured.	A suggested category is presented to the agent to review.
2	US-16 5 pts	As a support agent, I want AI to identify possible urgency and priority so that critical requests receive attention.	Ticket content is available and the AI recommendation service is configured.	An urgency and priority recommendation is presented to the agent for review.
3	US-17 3 pts	As a support agent, I want an AI-generated ticket summary so that I can understand lengthy conversations quickly.	The ticket contains conversation content and the AI summarization service is available.	A concise summary is generated and shown to the authorized agent.
4	US-18 5 pts	As a support agent, I want AI-generated response suggestions so that I can draft more replies more efficiently.	The agent is viewing a ticket with sufficient AI summarization service available.	A draft response suggestion is presented for agent review and editing; the agent retains control over sending it.
5	US-19 5 pts	As an end-user, I want an AI chatbot to answer common questions so that I can find more help quickly.	The chatbot interface and approved help information are available.	The chatbot provides a relevant answer or directs the user to support when it cannot answer reliably.
6	US-20 3 pts	As an administrator, I want a dashboard of ticket volumes, statuses, and resolution trends so that I can monitor support performance.	The administrator is authenticated and ticket records contain reportable status and timing information.	The dashboard displays ticket volume, status, and resolution-trend metrics based on available records
7	US-21 3 pts	As an administrator, I want to configure AI assistance options so that AI features can be managed responsibly.	The administrator is authenticated and has permission to manage AI configuration.	AI-assistance settings are saved and applied to the relevant AI features.

6. **Next-sprint selection or final-sprint disposition**

Sprint #3 select US-15 through US-21, totalling 29 points (34.1% of the backlog). The AI-features depend on ticket text, history, and stable ticket workflows from the first two sprints. The expected final increment adds AI category and urgency/priority suggestions, summaries, response suggestions, and end-user chatbot, administrator analytics, and AI-configuration.

Selected next-sprint stories and points: US-15, US-16, US-17, US-18, US-19, US-20, US-21 — 29 points (34.1% of the full backlog). The selected scope is approximately one-third of the total backlog and follows the dependencies established by the preceding sprint.

Expected functionality after the next sprint: At the end of Sprint 3, the system includes the planned AI-assisted functionality and administrative capabilities. AI suggests ticket categories and possible urgency and priority levels to help support agents classify requests. Agents can use AI-generated summaries of lengthy ticket conversations and response suggestions that they can review and edit before sending. End users can use an AI chatbot for common questions, with the chatbot directing them to support when it cannot answer reliably. Administrators can monitor ticket volumes, statuses, and resolution trends through an analytics dashboard and configure AI assistance options. Together, these capabilities complete the original planned product backlog.

Sprint 3 Report - AI Assistance and Administration

Planned stories: US-15, US-16, US-17, US-18, US-19, US-20, US-21 · 29 points · Objective: Deliver the remaining AI assistance, self-service, analytics, and administration capabilities.

1. Functionality at the end of this sprint

At the end of Sprint #3, the system includes the planned AI-assisted functionality and administrative capabilities. AI suggests ticket categories and possible urgency and priority levels to help support agents classify requests. Agents can use AI-generated summaries of lengthy ticket conversations and response suggestions that they can review and edit before sending. End users can use an AI chatbot for common questions, with the chatbot directing them to support when it cannot answer reliably. Administrators can monitor ticket volumes, statuses, and resolution trends through an analytics dashboard and configure AI assistance options. Together, these capabilities complete the original planned product backlog.

Expected project contribution: This sprint builds on the previous increment and creates a usable progression toward the full help desk workflow. The functionality described here should be treated as the sprint outcome only if it was implemented, integrated, and demonstrated by the team

2. User Stories Successfully Implemented

The following table lists the stories assumed to have been successfully implemented into the report. This assumption must be checked to the team's actual sprint review and definition of done before submitting.

US-15	AI Triage	As a support agent, I want AI to suggest ticket categories so that requests can be classified faster.	5	High	2
US-16	AI Triage	As a support agent, I want AI to identify possible urgency and priority so that critical requests receive attention.	5	High	2
US-17	AI Assistance	As a support agent, I want an AI-generated ticket summary so that I can understand lengthy conversations quickly.	3	Medium	2
US-18	AI Assistance	As a support agent, I want AI-generated reponse suggestions so that I can draft more replies more efficiently.	5	High	3
US-19	AI Chatbot	As an end-user, I want an AI chatbot to answer common questions so that I can find more help quickly.	5	Medium	3
US-20	Analytics	As an administrator, I want a dashboard of ticket volumes, statuses, and resolution trends so that I can monitor support performance.	3	Medium	3
US-21	Administration	As an administrator, I want to configure AI assistance options so that AI features can be managed responsibly.	3	Low	3

3. Changes, breakdowns, and newly identified stories

For this report, the team retained the original AI assistance and administrative stories. No additional breakdowns or changes to acceptance-criteria were required, and no new stories were introduced for immediate implementation. Development remained focused on completing the original product backlog.

4. Lessons learned and what to do differently next time

The team learned that AI must be integrated carefully into an existing software system. AI recommendations should assist agents rather than replace their judgment, and agents should retain control over reviewing and sending generated responses. Useful AI output also depends on accurate ticket records and conversation histories. If repeating the project, the team would allocate more time for AI testing, validate generated results with realistic ticket examples, and test AI-integration with the ticket workflow earlier.

5. Updated number lists of stories yet to be implemented, with preconditions and postconditions

Assuming all 21 original stories were completed and verified during the three sprints, there are no original product-backlog stories remaining unimplemented. Total complete score in this scenario: 21 stories and 85 points.

6. Next-sprint selection or final sprint disposition

This is the final planned sprint. Assuming all 21 original stories are verified as complete, no original backlog stories remain unimplemented. Future enhancements could include AI output quality monitoring, knowledge-base management for chatbot content, service-level agreement alerts and escalation, and accessibility improvements. These are proposed future stories, not approved or implemented requirements.

Proposed Stories	Explanation
AI Output Quality Monitoring	Allow administrators to review AI recommendations and evaluate their accuracy over time.
Knowledge Base Management	Allow administrators to create and update help articles used by the AI chatbot.
Service-Level Agreement (SLA) Alerts	Notify support agents and managers when tickets approach or exceed expected resolution deadlines.
Accessibility Improvements	Improves the interface so users with different accessibility needs can navigate and use the system effectively.
